

### Exercise #3 – Setting your working directory

1. Open your R script from Exercise #2
2. It is good practice to add comments to your programs labeling what each section is doing. Start by adding a R comment with the section name “setting up working directory”
3. Set your working directory to the folder that has your data in it
4. Make R print your working directory to make sure you set it properly
5. Using R comments, in 1 sentence briefly explain what a “working directory” means.
6. **IMPORTANT: The R code you used in question 3 should be in your Rscript. Moving forward, make sure all of your comments (section headers & explanations) and code are documented in the Rscript you created in Exercise 2. Do not forget to save this R script as you go!**
