

Exercise #2 – Writing R scripts

1. Open a new R script and add a title, description, and date to the top using comments
 - a. For example:

```
# Biostatistics Course – AAU 2019  
# YOURNAME  
# Pre-course exercises
```
2. Save this file by clicking the single floppy disk icon  on the on the top tool bar (or by clicking File > Save) and naming it “yourlastname_Intro_to_R_assignment”. For example, I would name my file “Devick_Intro_to_R_assignment” and save it to the “R programs” folder created in exercise #1.
3. **IMPORTANT:** The remaining exercises should all be documented in this R script. That means all of your code should be in this R script. The R script (top left window) is better than the “console” (bottom left window) because it saves all of your code and comments. At the end of the pre-course, you will send us this completed R script for review.
