

Exercise #5 – Importing data in R

1. Open your R script and add a new section for this exercise
2. Be sure the Rosmap dataset, “RM_xsect.csv”, is downloaded and saved in your “data” folder. Read the file Rosmap dataset into R using the `read.csv()` command and name the data frame “RM”. Hint, use the help functionality in R to learn more about the `read.csv()` command (e.g. enter the following: `?read.csv`)
3. Check that the data object “RM” appears in the ‘Environment’ window.
 - a. How many observations are there in RM?
 - b. How many variables are there in RM?
